ABSTRACT

A fault handling system which detects a fault
occurred in an information processing system, and performs

5   fault handling processing corresponding to the detected
fault in order to recover from the detected fault
condition. The fault handling system is provided with a
fault management table for storing operation mode
information indicating the operating status of the

10   information processing system and a type of fault handling
processing corresponding to the detected fault in the
information processing system in such a manner as to
relate the operation mode information with the type of the
fault handling processing, and a fault handling facility

15   for determining the operation mode information and
obtaining the type of fault handling processing
corresponding to the operation mode information determined
by referring to the fault management table.
